1. Press the power on/off button to turn power on.

2. Adjust the voltage knob to set the desired voltage. (Voltage level is shown on the digital display)

3. Adjust the current level pot with a small regular screwdriver to set the maximum desired current level. (The current level of the power supply is set to the maximum current level at the factory)

4. Connecting a load to the output terminals and pressing the output switch will illuminate the output indicator light and also display the current output setting on the digital display.

5. The sampling terminals are not normally used. Use them under the following conditions: if the load is located at a distance from the power supply, the sampling terminals may be used to compensate for the voltage drop inherent in longer power lines.
